

Amendments to the claims

Claim 1 (currently amended)

1. A method of communicating motion data through a distributed network, the method comprising the steps of:

- providing a content server, where the content server stores a plurality of hardware independent motion programs;
- providing a control software system for generating hardware dependent motion media based on hardware independent motion programs;
- providing a client browser for operating a target device based on hardware dependent motion media;
- connecting ~~a~~the control software system, ~~a~~the content server, and ~~a~~the client browser to ~~a~~the distributed network;
- ~~creating a motion program at the content server;~~
- using the client browser to identify over the distributed network a selected hardware independent motion program from the plurality of hardware independent motion programs stored by the content server;
- transferring the selected motion program from the content server to the control software system over the distributed network;
- generating selected hardware dependent motion media at the control software system based on the selected hardware independent motion program;
- and
- transmitting the selected hardware dependent motion media ~~to the client browser over the distributed network~~ to operate ~~a~~the target device associated with the client browser based on the selected hardware dependent motion media.

Claim 2 (currently amended)

2. A method as recited in claim 1, further comprising the steps of:
creating non-motion data at the content server;
combining the non-motion data with selected hardware dependent motion media
at the control software system to obtain enhanced selected hardware
dependent motion media; and
transmitting the enhanced selected hardware dependent motion media to the
client browser.

Claim 3 (currently amended)

3. A method as recited in claim 1, further comprising the steps of:
storing ratings rules associated with the client browser; and
modifying the hardware dependent motion media based on which the target
device operates based on the ratings rules.

Claim 4 (canceled)

Claim 5 (canceled)
